METHOD FOR AUTOMATED CONNECTION OF MULTIPLE PROCESSING MACHINES

ABSTRACT OF THE DISCLOSURE

A system and method of data communication between processing machines that includes receiving a message produced by a first processing machine at a database server. The message is transmitted via a socket protocol. The message is received in the database server. The received message is analyzed in the database server. The received message is stored when the received message is a processing data. The received message is transformed into a database instruction when the received message is an instruction.
